For context: I am a chaote and very interested in the union of science and paranormal phenomena.

This book is trying to be too many things at once, and this decoherence reduces its effectiveness in all areas. It's advertised as effectively a scientific paper on a novel multidimensional theory of physics to explain paranormal phenomena, but immediately the foreword and first chapter makes references to philosophical concepts like love and consciousness without formal definitions, later on devolving into consciousness-raising and anti-western new age sentiments. Some chapters are basically data dumps of very specific phenomenon, whereas others have a specific point and reference a variety of phenomena to "prove" it, which is scientifically backwards.

This is really 3 books smashed together into an incoherent mess which leaves its 3 audiences (scientists, psychics, and new agers) all dissatisfied. It needs to be split into 1. an academic paper detailing the theory, its qualitative and quantitative aspects, and suggested methodologies for further refinement, 2. a compendium of interesting validations of paranormal and psychic phenomena and 3. a treatise on how the world needs to raise its consciousness and how to do it.

As for the core theory, it reads a lot like it was thought of first and retroactively proven. Not that it's invalid, it feels more like the epicycle theories of planetary motion before we realized we had a solar system - epicycles, fittingly enough because the book talks a lot about fourier transforms which are intimately connected, are capable of describing all forms of movement with arbitrary precision. I think the theory is too general and needs a few years trying to reduce and simplify it as much as possible so it's able to make meaningful predictions with the primary goal of fitting as much phenomena as it can, piece by piece. Start with the 2 conjugate spacetimes because that has a lot of explanatory power - the surrounding "emotion", "mental", and "spiritual" planes are alarming to a skeptic and explain very little since none of these are ever actually defined quantitatively. The concept of deltrons feels like a hacky patch to the system and are treated effectively like magic "does whatever you want" particles, though I don't think it's entirely a lost cause because of how it connects to chaos magick. Chaos Magick says that belief is the primary means of reality manifestation, so conceptions of "energy" are ultimately psychological and infinite; experientially there does seem to be a fundamental limit, eg seance circles require several months of group effort for the "energy" to build, no matter how adept or believing its participants. Deltrons would resolve this, as they suggest there's infinite psychic energy in the conjugate plane, but access to it is limited by the concentration of deltrons.

As for the writing... Informationally it's very sparse. There are chunks of really terse technical

information, but in between the same things are repeated over and over again with the floweriest of language. This isn't academia, you don't have to impress anyone. Try to state things as tersely as possible - reading through, if anything could be removed without changing the meaning, remove it. And if many sentences contribute to one idea, combine them. I actually got so bored reading by page 220 that I started skipping pages, skimming, and even skipped the last 2 chapters (though I was already familiar with radionics). This could easily be a 100 page book if the fat was trimmed properly, which would make it much more accessible.

Thank you for coming to my TED talk

Difficult to read if you are not a math/physics whiz. Even so, there is much to gain by reading this book. So much of our understanding of physics a la Descartes is outdated in light of Tiller's experiments and models. This book will change your perception of things such as telepathy, clairvoyance, and healing through meditation. Mind blowing to say the least.

This book, which was a predecessor to Conscious Creations, is much better written and organized. I had a much easier time understanding the concepts, likely because there was an acronym list, a glossary, and because the author expressed the concepts in language that was much less technical than in Conscious Creations.

The book focuses on scientific experimentations dealing with paranormal powers. The thrust of the book is to prove (from a scientific perspective) that human intentionality can affect reality, and it seems that the author succeeds in doing this.

If there is one thing I'd like to see however, it's more awareness on the author's part of occult and magical works, which have focused on intentionality and the application of it to reality for a rather long time. This is not to say he should adopt such paradigms, but an awareness of previous literature can't hurt. Granted he may not feel that as a scientist he can do this, but given that his work is essentially focused on proving that intentionality affects reality, it'd be good for him to consider the previous perspectives on it.

### [5.0 out of 5 stars How to See the Unseeable & Know the Unknowable](#)

Reviewed in the United States on November 8, 2001

Dr. Tiller's excellent book, *SCIENCE AND HUMAN TRANSFORMATION*, boldly goes where few books dare to enter. Tiller presents a fascinating model of our universe as being multi-dimensional with a spiritual component. This book will likely be enjoyed most by readers who have experienced psychic or psycho-kinetic events in their lives, and are seeking a rational explanation for what might be going on. Those who have not yet had such experiences may not be convinced that such things exist -- even after reading Tiller's fascinating account of how he created a gas-discharge device in the 1970's while he was a professor at Stanford University which demonstrated that "anyone could produce a positive (psychokinetic) result".

*SCIENCE AND HUMAN TRANSFORMATION* is a joy to read for anyone who loves to play with new ideas and theories. It contains a wealth of schematic diagrams, charts, equations and references to support the theories Tiller presents. This book will most appeal to readers who love books they can ponder for some time, as it is packed with such ideas as: sensory arrays, etheric light cones, nodal networks and holograms.

The main point of *SCIENCE AND HUMAN TRANSFORMATION* is that the component of mind and consciousness has long been excluded from scientific study, and even omitted from Theories Of Everything (TOEs). Obviously, if we're going to have a theory of everything it had better include consciousness! Tiller knows this quite well, and artfully constructs a bridge for future scientists with open minds to cross over to a place where unseen things (such as human energy fields) have huge effects. If we want to know what has eluded us for so long, we need to go to the very places which are currently least well understood. *SCIENCE AND HUMAN TRANSFORMATION* provides a sturdy bridge for us to reach those previously unknown places.

Truly a scholarly- in depth -scientific approach to energies and phenomena currently outside common scientific acceptance. Not for the light hearted reader as it contains complex mathematics, physics and quantum mechanics, as tools to prove these phenomena which ultimately it does. It is interesting to note the experiments that have been conducted in a scientific manner, that show the interaction between the thought-reality process. This book goes into the group of literature that relates to how reality is ultimately a thought process. Being science savvy, it is a further insight, as to how quantum mechanics is finally providing "proof" of this. Definitely recommended

This book creates a bridge between modern physics and the realm of subtle energies. With well founded experiments and deep and suggestive theoretical ideas, it opens the way to an expansion of our scientific conceptions to include those other energies that are increasingly important for our comprehension of the world around us.
